WELCOME TO THE CONFERENCE

On behalf of the Steering Committee, of the Organizing Committee and of the Scientific Committee, we are glad to welcome all participants to the eighteenth edition of ICEAA, and to the sixth edition of IEEE APWC, the IEEE-APS Topical Conference on Antennas and Propagation in Wireless Communications. These two conferences share a common organization, registration fee, submission site, workshops and short courses, and social events.

The combination of these Conferences has a wide scope which includes all kinds of advanced applications in Electromagnetics and new technology developments. Broad areas are covered, ranging from Cognitive Radio to Electromagnetic Compatibility and Intentional Electromagnetic Interference; from Antennas, Propagation, and Components Technologies to Radar Cross Section and Asymptotic Techniques; from Electromagnetic Applications to Biomedicine to Computational Electromagnetics; from Wireless Communications to Metamaterials.

Altogether the two conferences feature 38 sessions including 19 special sessions organized by renowned experts. The ICEAA 2016 Conference program consists of 27 sessions and includes 16 Special Sessions; the IEEE APWC 2016 Conference program consists of 11 sessions, including 3 Special Sessions. About 270 papers are scheduled, out of the 527 submitted. As in previous editions invited papers will be presented at the Conferences, giving recent information on the state of the art and new technologies. We thank the Chair of the Scientific Committee (Prof. George Uslenghi) and reviewers for their contribution to the review of papers accepted for inclusion in the Conferences.

On Wednesday morning, September 21, a free half-day Short Course entitled “The physics and mathematics of the signal propagation mechanism in cellular wireless communication systems” will be given by Prof. T.K. Sarkar of Syracuse University, Syracuse, New York, USA. Two other full-day Short Courses will be held on Friday, September 23: one on “High-power electromagnetics” by Dr. D. V. Giri of the University of New Mexico, USA, and the other entitled “Introduction to aperture antennas and arrays” by Prof. T. S. Bird of Antengenuity / Macquarie University, Sydney, Australia.

The Conferences are organized by the Politecnico di Torino and by the Macquarie University. The Politecnico di Torino, a State University founded in 1859, is one of the major technical universities in Italy. Since its foundation in 1964, Macquarie has risen to be a progressive and influential institution in the sciences and engineering, both in Australia and internationally.

The Conferences are held at the “Cairns Convention Centre” Cnr Sheridan St & Wharf St, Cairns, Queensland, Australia. The award winning Cairns Convention Centre is only ten minutes from the Cairns International Airport which is Australia’s gateway to the Asia Pacific. The Centre is renowned for its unique environmental design and is the entry to the Great Barrier Reef and ancient tropical rainforests. Don’t miss the opportunity to visit the many interesting places in Cairns and its surroundings: we are sure you will enjoy them.

We look forward to seeing you in Cairns in September.

ICEAA - IEEE APWC 2016 BEST STUDENT PAPER AWARD

The ICEAA - IEEE APWC has established the ICEAA - IEEE APWC Award to recognize the author(s) who present at the ICEAA - IEEE APWC joint conferences an exceptional paper in terms of content and impact on Electromagnetics. In selecting the awardees, other factors considered are originality, clarity and timeliness of the paper. There will be up to two awards. One award will be for the best paper submitted by a student at an Australian or New Zealand university in IEEE Region 10, and one for the best paper submitted by a student in any IEEE Region. The ICEAA Scientific Committee gratefully acknowledges the financial support of the IEEE Antennas and Propagation Society in sponsoring the awards in IEEE Region 10. The awards in other Regions are sponsored by ICEAA - IEEE APWC.

A certificate and a prize of 1000 AUD will be awarded to the student in each category who has authored the best paper. In case of eligible coauthors who are registered participants at ICEAA - IEEE APWC, each awardee will receive a certificate and the cash award will be shared equally among them. The ICEAA Scientific Committee reserves the right to make no award if there are no papers of sufficient quality.

The finalists for this Award must present their paper in a special poster session scheduled for Monday afternoon, September 19 2016, on the Mezzanine Level of the Cairns Convention Centre. The winners of the ICEAA - IEEE APWC 2016 Best Student Paper Award will be announced at the Conference Banquet on Wednesday evening, September 21, 2016. Since the award announcement and presentation are made at the Conference Banquet, all candidates are expected to attend it.

PLENARY LECTURES

RECONFIGURABLE OVER-THE-AIR CHAMBER FOR MULTI-ANTENNA WIRELESS DEVICE TESTING

Prof. Michael A. Jensen
Brigham Young University, USA

Abstract - Over-the-air (OTA) testing of wireless devices is designed to assess performance of a radio with its antenna system in realistic communication environments. This is particularly important for multi-antenna devices since the ability of the array to enhance communication performance depends critically on the angular structure of the electromagnetic propagation. OTA device testing in realistic but repeatable environments is typically performed using either an expensive multi-antenna anechoic chamber that provides a high level of multipath control or a low-cost mode-stirred reverberation chamber that offers limited multipath control. We introduce a reconfigurable OTA chamber that is excited by a small number of feed ports and whose walls consist of programmable inhomogeneous electromagnetic reflectors. Simulations and measurements on two different prototypes of this topology demonstrate that through control of the wall reflection coefficients and the port excitations, the chamber offers significant control over the achieved fading distribution, spatial correlation, and power angular spectrum at the device under test.

Biography - Michael Jensen received the B.S. and M.S. degrees in Electrical Engineering from Brigham Young University (BYU) in 1990 and 1991, respectively, and the Ph.D. in Electrical Engineering from the University of California, Los Angeles in 1994. Since 1994, he has been a member of the faculty at BYU where he is currently a Distinguished University Professor of Electrical and Computer Engineering and the Dean

of the College of Engineering and Technology. He has published over 250 articles and book chapters on the topics of antennas, propagation, and signal processing for wireless communication, with emphasis on multi-antenna communication systems. He has been recipient of the Best Student Paper Award at the IEEE Antennas and Propagation Society Symposium in 1993, the H. A. Wheeler Applications Prize Paper Award in the IEEE Transactions on Antennas and Propagation in 2002, and several outstanding faculty awards at Brigham Young University. He was elevated to the grade of IEEE Fellow in 2008. He is currently President of the IEEE Antennas and Propagation Society and has previously served as the Editor-in-Chief of the IEEE Transactions on Antennas and Propagation.

THE AUSTRALIAN SQUARE KILOMETER ARRAY PATHFINDER AND FUTURE DIRECTIONS IN SKA

Dr. Stuart G. Hay
CSIRO, Australia

Abstract - The Australian Square Kilometer Array Pathfinder (ASKAP) is a new telescope for radio astronomy being developed by CSIRO on a radio-quiet site in Western Australia. It features innovative phased array feeds (PAFs), combining wideband and tightly coupled antenna elements closely integrated with low-noise amplifiers and followed by extensive digital processing. This expands the instantaneous field-of-view of the telescope, allowing fast and sensitive surveys over the 0.7-1.8GHz range and providing opportunity for discovery of transient phenomena. Commencing in 2007, the project has been through a number of stages of technology development and has now reached a commissioning phase, where the benefits of the PAFs are being demonstrated. This talk will review ASKAP developments and discuss future directions in the international SKA project.

Biography - Stuart G. Hay received the B.E and Ph.D in Electrical Engineering from the University of Queensland in 1985 and 1994 respectively. From 1986 to 1989 and since

1994 he has been with Australia's CSIRO where he is currently a Principal Research Scientist. He has worked on various aspects of Electromagnetics and Antennas with publications on shaped reflectors, wide field-of-view multibeam and beam-scanning antennas and connected arrays. Stuart served as Associate Editor of the IEEE Transactions on Antennas and Propagation from 2008-2013. He was a guest Editor of a special issue of this journal, on Antennas for Next Generation Radio Telescopes. From 2009-2015 Stuart was Chair of the Technical Program Committee of the Australian Symposium on Antennas.

**THE PHYSICS AND MATHEMATICS
OF THE SIGNAL PROPAGATION MECHANISM
IN CELLULAR WIRELESS COMMUNICATION SYSTEMS**

Instructor: Tapan K. Sarkar Syracuse University, Syracuse, NY, USA

The objective of this short course is to introduce a new physics based visualization of the Electromagnetic wave propagation mechanism in cellular wireless communication systems. We also illustrate from a mathematical point of view that an electromagnetic macro model can accurately predict the dominant component of the propagation path loss in a cellular wireless communication. The reason a macro model can provide accurate results that agree with experiments is because the trees, buildings, and other man made obstacles contribute second order effects to the propagation path loss as the dominant component is the free space propagation of the signal and the effect of the Earth over which the signal is propagating. It is demonstrated using both measurements and an analytical theoretical model that the propagation path loss inside a cellular communication cell is first about 30 dB per decade of distance and later on, usually outside the cell, it is about 40 dB per decade of distance between the transmitter and the receiver irrespective of their heights from the ground. This implies that the electric field decays first at a rate of $\rho^{-1.5}$ inside the cell and later on, usually outside the cell, as ρ^{-2} , where ρ stands for the distance between the transmitter and the receiver. It will also be illustrated that the so called slow fading is due to the interference between the direct wave and the ground wave as introduced by Sommerfeld over a hundred years ago. All these statements can be derived from the approximate integration of the Sommerfeld integrals using a modified path for the steepest descent method and also using an accurate purely numerical methodology. An optical analog model will be presented based on the image theory developed by Van der Pol to illustrate the mechanism of radio wave propagation in a cellular wireless communication system where the path loss is 30 dB per decade or the field decays as $\rho^{-1.5}$. This macro model is used to refine the experimental data collection system for the propagation path loss and it is also illustrated how the antenna tilt both mechanical and electrical can be incorporated in the macro model to predict the propagation path loss. Finally, an observation is made on how to further improve the propagation mechanism by observing the second channel from the mobile to the base station. Numerical data will reveal that the proposed methodology is a much better way to deploy base station antennas.

SHORT COURSE ON

HIGH-POWER ELECTROMAGNETICS

Instructor: Dave V. Giri University of New Mexico, USA

OUTLINE

- 1) **Classification of HPEM based on bandwidth**
UWB and High-Power Microwave (HPM) are parts of many types of HPEM signals. International IEC Standard 61000-2-13 on classifying High-Power EM signals will be discussed.
- 2) **HPM Sources and Phase Locking**
Various vacuum devices like Magnetron, Klystron, Reltron, and Vircator etc will be discussed. Ways of phase-locking HPM sources will be discussed here.
- 3) **HPM Facilities and their Capabilities and Diagnostics:**
Review of some of the indoor and outdoor HPM facilities that exist in the world. Antenna design, type of HPM source, the type of antenna for some of these systems will be discussed.
- 4) **High-Power Moderate Band Systems:**
This is an emerging technology. HPM is a single frequency signal. We are now building High-Power systems with 10 to 20 % bandwidth. Source technologies, antenna systems and how they are used for vulnerability measurements will be discussed.
- 5) **Hyperband Systems:**
Ultra-wideband (UWB) systems that radiate very high-level transient waveforms and exhibit operating bandwidths of over two decades are now in demand for a number of applications. Such systems are known to radiate impulse-like waveforms with risetimes around 100 picoseconds (ps) and peak electric field values of 10s of kV/m.
- 6) **The most powerful UWB System**
We describe a large, high voltage transient system built at the Air Force Research Laboratory, Kirtland AFB, NM, during 1997-1999. The pulsed power system centers on a very compact resonant transformer capable of generating over 1 MV at a pulse repetition frequency (PRF) of 600 Hz. This is switched via an integrated transfer capacitor and an oil peaking switch onto an 85-W Half-IRA (Impulse Radiating Antenna). This unique system will deliver a far radiated field with a full-width half maximum (FWHM) on the order of 100 ps, and a field-range product ($r E_{far}$) of ~ 5.3 MV, exceeding all previously reported results by a factor of several.
- 7) **Application of Hyperband Systems:**
With Hyperband systems with bandwidths of nearing the theoretical maximum of 200%, many applications become possible. These applications have evolved in the last 5 to 8 years.
- 8) **Documented EM Effects:**
EM effects are real and they happen all the time, even in civilian facilities such as hospitals and on board aircrafts. A list of documented EM effects will be discussed.

The cost of the Workshop is AU\$80; it includes refreshments.

SHORT COURSE ON

INTRODUCTION TO APERTURE ANTENNAS & ARRAYS

Instructor: Prof. Trevor S. Bird, FTSE, LFIEEE, Macquarie University, Antengenuity, PO Box 306, Eastwood NSW 2122, Australia

The topic of aperture antennas includes many antennas in common daily use. Typical examples include waveguides, horns, reflectors, lenses, slits, slots and microstrip antennas. In this Workshop the underlying theory of these antennas is described as well of their applications. The intention is to provide an introduction to some basic aperture antennas and their design. It will be assumed that attendees are familiar with the basics of Maxwell's equations, fields and waves.

Aperture antennas are normally associated with directional beams and, indeed, this is their role in many applications. Aperture antennas can also occur on non-planar or curved surfaces such as on aircraft or ground-based vehicles. These antennas may consist of a single radiator or in arrays. In this form they are often used to provide directional or shaped beams.

A limitation of a directional planar antenna is that when it is scanned from broadside the beam broadens and the pattern deteriorates. When the antenna is conformal to a convex surface, such as a cylinder or a cone, the beam can be scanned in discrete steps through an arc while maintaining a constant pattern. Of importance in the design of low sidelobe antenna arrays, both planar and conformal, is predicting the effect of mutual coupling between the array elements. Maximum performance is achieved from arrays when the coupling between elements is fully taken into account.

The cost of the Workshop is AU\$80; it includes refreshments and a copy of the author's book 'Fundamentals of Aperture Antennas and Arrays', which the attendees will receive when they arrive. The book will be used as the notes for the Workshop.

Topics to be covered include:

- 1) **Introduction (30 min)**
